Work Experience – 5+ years

Areas of Expertise

- Software Engineering
- Data Pipelines & Automation
- Dashboard Reporting
- Workflow Automation
- Systems Integration
- Cloud Infrastructure
- Web Development
- Structured Data Systems
- Artificial Intelligence
- Process Automation

Languages

- English

Employment History

- GetFlow – Contributions Management Platform
- UK Homelessness Support Data Pipeline
- Self-Hosted Remote Development Environment
- Opportunity DecisionAI
- Power Apps – RightFirstTimeApp
- Power Automate
- Power BI
- Power BI Timesheet Dashboard

Management Experience

- Workflow Automation
- Dashboard Reporting
- Systems Integration
- Stakeholder Communication
- Problem Solving
- Process Automation

Design Experience

- Dashboard Reporting
- Data Modelling
- Responsive Reporting Tables
- Structured Data Systems
- User Interface Design
- Recommendation Interfaces
- Role-Based Access Controls

Digital Experience

- Programming – Python, JavaScript, TypeScript, SQL
- Frontend Development – React, Next.js, Tailwind CSS
- Power Platform – Power BI, Power Apps, Power Automate
- Data Engineering – BeautifulSoup, Requests, JSON
- Cloud Infrastructure – Cloudflare, Supabase
- Systems – Linux, WSL, Bash, YAML
- Version Control – Git
- Database & Reporting – SQL, Power Query, Excel/SharePoint Integration

Driving Licenses

- UK

CAREER SUMMARY

Emmanuel's career has been defined by developing scalable digital solutions across software engineering, automation, data systems, and reporting environments. From building web platforms and structured data pipelines to delivering dashboard reporting solutions and workflow automation tools, he has consistently focused on improving operational efficiency, accessibility, and system usability across projects.

Driven by a passion for technology and problem solving, Emmanuel's expertise spans Python development, Power Platform technologies, cloud infrastructure, frontend development, and systems integration. His work combines practical software engineering with automation and data-driven decision making, enabling organisations and users to streamline processes, improve reporting visibility, and build scalable digital solutions

With a strong interest in digital innovation and emerging technologies, Emmanuel continues to develop solutions that bridge software engineering, automation, and intelligent systems. Through projects involving recommendation platforms, reporting systems, remote development infrastructure, and data aggregation pipelines, he remains committed to building reliable, efficient, and future-focused technology solutions.

EDUCATION

Digital and Technological Solutions - University of Roehampton, 2025
United Kingdom

PROFESSIONAL EXPERIENCE (ATKINSRÉALIS UK)

Project: GetFlow – Contributions Management Platform

GetFlow is a web-based contributions management platform developed to help organisations manage payments, contributions, and internal reporting processes through a secure and scalable digital environment.

- **Admin Dashboard & Access Control**
Developed a secure admin dashboard with role-based access controls and protected routes to improve system security and operational management. Implemented responsive reporting tables, contribution summaries, and filtering systems to improve reporting visibility and usability
- **Platform Development & Deployment**
Built and deployed a live production environment under a custom domain using React, Next.js, TypeScript, JavaScript, SQL, and Supabase. Focused on scalable frontend architecture and structured data handling for improved maintainability and performance

Project: UK Homelessness Support Data Pipeline

The UK Homelessness Support Data Pipeline project was developed to aggregate homelessness support service information from public sources into structured and reusable datasets for future expansion and accessibility.

- **Data Pipeline & Automation**

Built scalable Python-based data pipelines capable of aggregating fragmented public data sources into structured outputs. Developed automated web scrapers using BeautifulSoup and Requests to improve data collection efficiency and consistency.

- **Structured Data Systems**

Created reusable schemas for contacts, locations, and service information while designing a modular architecture that supports onboarding of future providers and scalable data expansion.

Project: Self-Hosted Remote Development Environment

The Self-Hosted Remote Development Environment project focused on creating a browser-accessible remote coding infrastructure hosted on personal hardware to improve accessibility and development flexibility.

- **Infrastructure & Cloud Configuration**

Configured a WSL Ubuntu environment and deployed code-server to enable remote coding access through the browser. Secured public access using Cloudflare Tunnel integration and custom domain routing for secure external accessibility.

- **Automation & System Reliability**

Automated startup and service recovery processes while maintaining Linux-based infrastructure using Bash scripting, YAML configuration, and cloud-based routing solutions.

Project: Opportunity DecisionAI

Opportunity DecisionAI is an MVP recommendation platform designed to help users identify career and income opportunities based on user-specific onboarding and ranking systems.

- **Recommendation Platform Development**

Designed onboarding questionnaires and ranking engines based on user inputs to support recommendation logic and personalised opportunity identification. Developed dashboard and recommendation interfaces using React, Next.js, TypeScript, JavaScript, SQL, and Tailwind CSS.

- **AI-Ready Backend Structure**

Prepared backend architecture for future AI integrations and scalable data expansion, focusing on modularity and future system extensibility.

Project: Power Platform & Reporting Solutions

- **Power Apps – RightFirstTimeApp**

Developed Power Apps dashboard solutions to improve data storage efficiency and operational workflows. Designed user interfaces, custom forms, and workflow integrations with Microsoft Power Platform services including Power Automate.

- **Power Automate**

Created automated request workflows connecting multiple data sources including databases, spreadsheets, Excel, and cloud services to streamline approvals and communication processes between managers and employees.

- **Power BI**

Developed interactive reports and dashboards using charts, tables, maps, and custom visuals to improve reporting visibility, uncover trends, and support data-driven insights.

Project: Power BI Timesheet Dashboard

The Power BI Timesheet Dashboard project focused on reconnecting, restructuring, and improving reporting systems linked to Excel and SharePoint data sources for management reporting purposes.

- **Data Transformation & Troubleshooting**

Updated and reconnected Power BI reports to new Excel and SharePoint data sources while resolving issues involving broken SharePoint URLs, worksheet references, authentication permissions, and inconsistent date formatting caused by UK and US locale differences.

- **Reporting & Dashboard Development**

Cleaned and transformed data within Power Query, rebuilt report visuals, and designed interactive reporting components including supervisor-based filtering tables, matrix views, and non-submission reporting dashboards to improve usability and management visibility.

- **Dashboard Usability Improvements**

Improved user experience by replacing inefficient tooltip and drill-through approaches with more effective visual interactions between charts and reporting tables, enabling clearer and more actionable insights for managers.
